^{*}This file has version number v1.6, last revised 2006/01/20.

 $^{^\}dagger Great$ thanks to Denis G. Samsonenko<code>@gmail.com></code> who proposed many significant improvements to the package.

1 The Scope and Objectives

The package provides a new implementation of sections, captions, and toc-entries independent on the LATEX kernel. The reasons for this are concerned with the following disadvantages of the standard LATEX implementation:

- 1 Standard LATEX sectioning commands can prepare display sections in the single style: justified paragraph with hang indented number. To change this style to another one (centered, par-indented, or else), you need to re-implement the internal \@sect command. It is no control for this style on user's level.
- 2 If you want to customize the presentation a number in a section (for example, put a paragraph mark § before a number or put a point after a number), you at least need to re-implement the \@sect command.
- 3 The sectioning commands provide no straightforward control for running headings. The marking commands like the \sectionmark solve this problem partially. Using them within parameter of sectioning command, you can change the mark properly, but this solution does not work in complicated documents which use first and last marks appearing on a page. The safe solution consists in direct replacement a mark prepared within the \@sect command to a custom mark.
- 4 Special efforts are required to pass a section without number to the header and to the toc-list. There is no simple solution providing this action.
- 5 Captions for tables and figures are prepared in just the same way, although, they are usually used in different places of floating environments: table captions start *before* a table, but figure captions go *after* a figure. So, the vertical skip inserted before a caption is unnecessary for table captions. The right solution is to design captions for different float types in different ways.
- 6 The star-form of captions is absent. It is useful when a document contains an alone figure or table. Moreover, in fiction books, unnumbered captions useful.
- 7 The design of toc-entries is hard for modifications. It is much better to calculate the skips in toc-entries on the base of prototyping technique instead of hard-coding them with absolute values. Moreover, the skips for nested sections must depend on higher level skips. For example, if we change skips for a section entry, the skips for subsection entries should be adjusted automatically.

The package eliminates above-mention disadvantages of the standard IATEX implementation. The commands implemented in it are divided into two levels: user level and design level. The user-level commands are intended for use within a document and the design-level commands are directed to class and package writers.

2 User Interface

The table below shows sectioning commands provided with standard LATEX classes. Every section has a level (an integer number). Sections can be printed in one of two modes: display or running mode. Display section is prepared as a separate justified paragraph having a hang indent if a section has a number. Running section starts a paragraph.

Command	Level	Mode
\part	$-1 \text{ or } 0^1$	display
\chapter	0^{2}	display
\section	1	display
\subsection	2	display
\subsubsection	3	display
\paragraph	4	running
\subparagraph	5	running

\startsection

The package redefines all standard sectioning commands. Along with the commands shown in the table above, you can use the following uniform notations:

```
\time {\langle level \rangle} [\langle toc\text{-}entry \rangle] {\langle title \rangle}  or
\startsection{\langle level \rangle} *{\langle title \rangle}
```

The $\langle level \rangle$ is a level of section. A negative level produces a part. The first command produces a numbered section (if the numbering depth allows this) and the last one produces a section without number. As for the standard LATEX sectioning, the first variant of the \startsection command additionally passes their arguments to the section mark command (if the mark command exists) and to the aux-file. The last variant does no additional actions.

NOTE: The package allows declaring additional section levels. They, of course, have no predefined alias names as standard section levels.

\sectionstyle

The \sectionstyle[$\langle type \rangle$] { $\langle style \rangle$ } command allows change a style of subsequent display sections of the given $\langle type \rangle$:

main the section of zero level (\part or \chapter);

section the \section: the \subsection: subsection subsubsection the \subsubsection; the \paragraph; paragraph subparagraph the \subparagraph;

section@vi the section of 6th level, and so on.

¹The \part command has zero level in article-like classes and has the negative level in booklike classes. In book-like classes a part is prepared on a separate page.
²The \chapter command is defined in book-like classes only.

If the $\langle type \rangle$ parameter is omitted, the command acts on all subsequent display sections expect those having a specialized style. The following styles are predefined:

hangindent standard LaTeX style (default);

hangindent* the same as hangindent, but ragged right;

parindent title indented on \parindent;

parindent* the same as parindent, but ragged right;
hangparindent \parindent indented with hang number;
hangparindent* the same as hangparindent, but ragged right;

center centered title;

centerlast justified title without indent whose last line is centered.

You can apply the \sectionstyle so many times in the document as you want. This command complies with standard LaTeX scoping rules.

NOTE: The section style acts on display sections that were prepared with the dynamic alignment (see Section 4). By default, the sections of levels from 0 to 3 have the dynamic alignment. The section of zero level has no hang indentation.

\sectiontagsuffix

The \sectiontagsuffix[$\langle type \rangle$] { $\langle style \rangle$ } command allows change a suffix inserted after number tag for sections of the given $\langle type \rangle$. If the $\langle type \rangle$ parameter is omitted, the command acts on all subsequent sections expect those having a specialized tag suffix.

\indentaftersection \noindentaftersection

The paragraph indentation after a display section is controlled with the \indentaftersection and \noindentaftersection commands. The first one allows and the last one suppresses indentation after section. The commands act on the subsequent display sections in the scope of their use.

\aftersectionvspace

If a document contains two subsequent sectioning commands (for example, \section and \subsection) the distance between their titles is equal to the skip after the first sectioning command. Sometimes it is necessary to insert another vertical space here. To override the space inserted between sections, use the command

```
\verb|\aftersectionvspace|{\langle distance \rangle}|
```

This command replaces the space inserted by a previous sectioning command with the $\space{\langle distance \rangle}$. It works in the only case when goes right after a command producing a display section. Otherwise, the specified $\langle distance \rangle$ is ignored. The following example shows how to customize the $\space{\space}$ subsection command in such a way that the distance between it and a previous $\space{\space}$ sex plus .5ex minus .2ex:

```
\renewcommand\subsection{%
  \aftersectionvspace{3ex plus .5ex minus .2ex}%
  \startsection{2}}
```

\adjustsectionmargins

Margins of a display section can be adjusted using the command

```
\adjustsectionmargins{\langle left\ skip \rangle}{\langle right\ skip \rangle}
```

The $\langle left \; skip \rangle$ and $\langle right \; skip \rangle$ are added to the left and right margins of the subsequent section if it is a display section. Otherwise, this command is ignored.

Modifiers. The customization of a number tag and running head of a particular section is provided with so-call *modifiers*. A modifier is a command acting on the nearest sectioning command going after it. Usually, the modifiers are placed just before a sectioning command. All modifiers act on non-starred versions of sections. If the next sectioning command is starred, modifiers are ignored.

\norunninghead

The \norunninghead modifier suppresses generation of running head for the next non-starred section, i.e. it skips the call of section mark command in the next section.

\runninghead

The $\runninghead{\langle running-title\rangle}$ modifier overrides a text going to the running head when a new non-starred section starts and an appropriate $\partial pagestyle$ is in use. This command has higher priority than the $\normalfont{normninghead}$.

\noheadingtag

The \noheadingtag modifier suppresses a number tag in the next section, but all other attendant actions are executed (writing to the aux-file and updating the running head).

\headingtag

The $\headingtag\{\langle tag \rangle\}\$ modifier overrides a number tag in the next section. It has the higher priority than \headingtag . Overridden section tag can be referred with the \headingtag . All fragile commands in the overridden tag should be protected.

\headingtag*

The $\headingtag*{\langle tag \rangle}$ modifier prepares a number tag as is, ignoring the tag style, prefix, and suffix. The aux-file and running head are not updated in this case.

\skipwritingtoaux

The $\strut \strut \st$

NOTE: All modifiers use global settings.

\caption \caption*

The captions are implemented in this package using the same technique as the sectioning commands. There are two versions of caption command allowed within floating environments:

```
\label{lem:caption} $$ \operatorname{caption} {\langle toc\text{-}entry\rangle} {\langle title\rangle} $$ and $$ \operatorname{caption} {\langle title\rangle} $$
```

The first one works in the same manner as the standard LATEX \caption command. Its starred version prepares a caption without number and preceding words 'Figure' or 'Table'.

You can use line breaking commands in captions. But in this case, you need to set the optional $\langle toc\text{-}entry \rangle$ parameter to avoid translation errors.

Caption appearance can be customized. You can customize ether all caption types or only selected caption type. The following commands do this:

```
\label{eq:captionstyle} $$ \captiontagstyle[\langle type\rangle] {\langle style\rangle} $$ $$ \captiontagsuffix[\langle type\rangle] {\langle suffix\rangle} $$ $$ \captionwidth[\langle type\rangle] {\langle length\rangle} $$
```

If $\langle type \rangle$ is omitted and these commands appear out of float environments, they are applied to all types. A command without $\langle type \rangle$ applied within a float environment is considered as a command having the type of this environment. Typed version of a command has a precedence before a non-typed one.

\captionstyle specifies a style the caption text will be formatted:

default standard LATEX's style,

para simple paragraph without paragraph indent,

left all lines are flushed left,
center all lines are centered,

right all lines are flushed right, or

centerlast as para, but the last line is centered.

\captiontagstyle specifies a position of caption tag:

para tag is formatted together with text,

left tag is adjusted to the left in a separate line,

center tag is centered in a separate line, or

right tag is adjusted to the right in a separate line.

\captiontagsuffix specifies a suffix after caption tag.

\captionwidth specifies a width of caption.

Defaults:

```
\captionstyle{default}
\captiontagstyle{para}
\captiontagsuffix{:\hspace{0.7em plus 0.2em minus 0.1em}}
\captionwidth{\linewidth}
```

NOTE: The above-described section modifiers can be used with non-starred captions. Although, the \runninghead and \norunninghead commands have no sense with captions, but you can do them working if define a \figuremark{} or \tablemark{} command.

\SetTOCStyle

The $\texttt{SetTOCStyle}\{\langle declarations \rangle\}$ command allows customize the table of contents and other content lists. For example, the declaration

\SetTOCStyle{\small}

specifies that content lists will be prepared with the \small font. This command is allowed in the preamble only.

\ChapterPrefixStyle

The appearance of Chapter/Appendix prefix in a table of contents and in a running head can be customized using the command

```
\ChapterPrefixStyle{\langle appearance\ list\rangle}
```

The $\langle appearance\ list \rangle$ can contain up to two words, namely header and/or toc, delimited with a comma. Using them, you can set a prefix-style for the header and/or the table of contents, respectively. By default, the prefix-style is specified for the header only. This command is allowed for book-like classes in which the \c hapter command is defined. It can be used in the preamble only.

3 Create New Section Styles

\newplainsectionstyle

Along with 8 predefined section styles, you can easy create more styles. The command

```
\label{eq:loss_loss} $$\operatorname{loss_{(name)}}_{(indent)}[\langle pos\rangle] $$ {\langle left\ skip\rangle}_{(right\ skip)}$$
```

creates a new paragraph-like section style with the given $\langle name \rangle$. It has the $\langle indent \rangle$ paragraph indent and margins specified with $\langle left\ skip \rangle$ and $\langle right\ skip \rangle$ lengths. To prepare a centered style, the optional $\langle pos \rangle$ parameter should be equal to [c]. In this case, left and right margins must have an additional 1fil glue. If optional parameter is [r], the left margin must have an additional 1fil glue.

Four of predefined section styles are created using this command as follows:

```
\newplainsectionstyle{parindent}{Opt}{\parindent}{Opt}
\newplainsectionstyle{parindent*}{Opt}{\parindent}{Opt plus 1fil}
\newplainsectionstyle{center}{Opt}[c]{Opt plus 1fil}{Opt plus 1fil}{\newplainsectionstyle{centerlast}{Opt}[c]{Opt plus 1fil}{Opt plus -1fil}
```

Analogously to the centerlast style, the rightlast style (last line is adjusted to the right) can be easy created:

\newplainsectionstyle{rightlast}{Opt}[r]{Opt plus 1fil}{Opt plus -1fil}

\newhangsectionstyle

The command

```
\newhangsectionstyle{\langle name \rangle}{\langle min\ tag\ width \rangle}[\langle pos \rangle] {\langle left\ skip \rangle}{\langle right\ skip \rangle}
```

creates a new hang-indented section style with the given $\langle name \rangle$. The $\langle min\ tag\ width \rangle$ length specifies a minimum width of the section tag. If a width of section tag is less than this parameter value, a white space will be inserted surround the tag to have the required width. The method of inserting a white space is the same as in the \makebox command. It is controlled with the optional $\langle pos \rangle$ parameter (1, c, or r; 1 default). Other parameters have the same meaning as in the previous command.

Four of predefined section styles are created using this command as follows:

```
\newhangsectionstyle{hangindent}{Opt}{Opt}{Opt}
\newhangsectionstyle{hangindent*}{Opt}{Opt}{Opt plus 1fil}
\newhangsectionstyle{hangparindent}{Opt}{\parindent}{Opt}
\newhangsectionstyle{hangparindent*}{Opt}{\parindent}{Opt plus 1fil}
```

The following examples shows possibilities of these commands:

3.1 This subsection was prepared in the margin style

The definition of the margin style is the following:

 $\newhangsectionstyle\{margin\}\{2in\}[r]\{-2in\}\{0pt\ plus\ 1fil\}$

3.2 This subsection was prepared in the list style

The definition of the list style is the following:

\newhangsectionstyle{list}{1in}{0pt}{1in plus 1fil}

3.3 This subsection was prepared in the flushright style

The definition of the flushright style is the following:

\newplainsectionstyle{flushright}{Opt}[r]{1in plus 1fil}{Opt}

4 Declare Sections and Captions

\DeclareSection

To define or redefine a section or caption command, you can use in the preamble of your document the following command:

```
\label{eq:level} $$ \ | \langle level \rangle | (\langle level \rangle) | \langle level \rangle | \langle
```

- (level) a section level number. Zero and negative values are interpreted as follows: 0 means declaring the \chapter or \part command depending on a class used; a negative value means declaring a caption.
- $\langle type \rangle$ a section type. For zero level, this parameter is ignored. For negative level, it defines a float type (i.e., figure or table). For positive level, it defines a counter name. The name of marking command is composed from the type as $\langle type \rangle$ mark.
- $\langle indent \rangle$ indentation of heading from the left margin (zero is default). Ignored for negative levels.

a prefix inserted before a section-number tag (usually empty). In
chapter, part, or caption declaration commands, it is inserted
right before the tag name, e.g., before the \@chapapp, \partname,
\figurename, or \tablename command.

 $\langle beforeskip \rangle$ the skip to leave above the heading.

(afterskip) if positive, then the skip to leave below the heading, else negative of skip to leave to right of running heading. The negative value is allowed for positive section levels only.

(style) commands to set a style. The last command in this argument may be a command such as \MakeUppercase that takes an argument. The section heading will be supplied as the argument to this command. So setting it to, say, \bfseries\MakeUppercase would produce bold, uppercase headings.

Sections having nonnegative $\langle level \rangle$ and positive $\langle afterskip \rangle$ are display sections. They are declared with the hangindent style and do not obey the \sectionstyle command.

\DeclareSection*

To declare a display section having dynamic alignment controlled with the \sectionstyle command, use the star-version of the previous command:

```
\label{eq:local_local_local} $$ \operatorname{ction}_{{\langle level\rangle}_{{\langle type\rangle}_{{\langle type\rangle}_{{\langle style\rangle}_{{\langle type\rangle}_{{\langle type\rangle}
```

A negative $\langle afterskip \rangle$ has no meaning in this case.

\bff

To prepare bold section headings, you can use the $\$ bff command in the $\langle style \rangle$ parameter. It tries to set everything bold. Its definition is the following:

\newcommand{\bff}{\normalfont\bfseries\mathversion{bold}}

Examples of section and caption declarations:

Here we declare the table caption command with zero skip before it and 10pt skip after it. On contrary, the figure caption command produces 10pt skip before it and zero skip after it. The \section command is declared with dynamic horizontal alignment. It is prepared in the \Large font with everything bold.

\SectionTagSuffix

The $\SectionTagSuffix{\langle suffix\rangle}$ command specifies a default suffix inserted after a section number tag. For example, the command

\SectionTagSuffix{.\quad}

sets the decimal point after every section number tag. Sections of 0th level ignore this suffix. The default tag is \quad. The command can be used in the preamble only.

\RunningSectionSuffix

The $\mbox{\sc RunningSectionSuffix}{\sc uffix}$ command specifies a suffix inserted after a running section title right before the skip after section. It can be used in the preamble only. The default value is an empty suffix.

\norunningsuffix

To remove the suffix after a running section, put the \norunningsuffix modifier in the parameter of running section.

\CaptionTagSuffix

The $\CaptionTagSuffix{\langle suffix\rangle}$ command specifies a default suffix inserted after a caption number tag. It can be used in the preamble only. The default caption tag is:

\CaptionTagSuffix{:\hspace{0.7em plus 0.2em minus 0.1em}}

5 Declare TOC-Entries

\DeclareTOCEntry

To declare an entry of table of contents or other lists (list of figures or list of tables), use the following command (in the preamble only):

```
\label{lem:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma:lemma
```

\(\lambda \left{level}\rightarrow\) a section level number. For zero and negative level the following commands are created: 0 means \l@chapter or \left\left[0]part depending on class used; -1 means \l@figure; -2 means \l@table. If level is greater than 5, the name of toc-entry command is generated as \l@section@\left\left{level-in-roman}\rightarrow\, i.e., the toc-entry of 6th level is \l@section@vi.

(action) commands applied before entry is produced (usually empty).

(prefix) text inserted before the section number (usually empty).

(prototype) prototype of number for alignment the toc-entry body. The hang indent of this toc-entry will be equal to the width of

 $\langle style \rangle \{\langle prefix \rangle \langle prototype \rangle \langle number line-suffix \rangle \}$

(style) commands to set a style. The last command in this argument may be a command such as \MakeUppercase that takes an argument. The produced entry will be supplied as the argument to this command. So setting it to, say, \bfseries\MakeUppercase would produce bold, uppercase entry. This style is applied to the number also and to the page number. To apply different styles to the text of entry and to its page number, use in this parameter the command

 $\langle next \rangle$ prototype for left margin adjustment for an entry of the next level. Default is the hang indent of the current toc-entry.

A toc-entry is produced within a group.

\NumberlineSuffix

The \NumberlineSuffix{ $\langle calc\text{-}suffix\rangle$ }{ $\langle actual\text{-}suffix\rangle$ } command allows customize a skip inserted after numbers in TOC-like entries. The $\langle calc\text{-}suffix\rangle$ parameter is used in calculations of hang indent of toc-entries and the $\langle actual\text{-}suffix\rangle$ is really inserted at the end of number. The { $\langle calc\text{-}suffix\rangle$ } is usually wider than the $\langle actual\text{-}suffix\rangle$. The default is \NumberlineSuffix{\quad}{\end{themskip}}. This command is available in the preamble only.

\PnumPrototype

The $\prototype{\langle prototype \rangle}$ command is used for adjustment the right margin of the text of toc-entries in toc-lists. Default is $\prototype{99}$. If your document has more than 99 pages, use $\prototype{999}$. This command is available in the preamble only.

\TOCMarginDrift

The \TOCMarginDrift{\(\langle increment\)\} command specifies a value of right-margin drift in TOCs. The increment is applied after the \@plus token in definition of right margin. Empty argument means no drift. Examples:

```
\TOCMarginDrift{2em}
\TOCMarginDrift{1fil}
```

The command can be use anywhere in the document.

\runinsectionskip

This command is useful in the $\langle action \rangle$ parameter of the toc-entry declaration to produce the skip before a toc-entry equal to the skip before run-in sections.

The following example shows how toc-entries are declared in books:

```
\DeclareTOCEntry{-2}{}{}{9.9}{}% table
\DeclareTOCEntry{-1}{}{}{9.9}{}% figure
\DeclareTOCEntry{0}{\runinsectionskip\def\@dotsep{1000}%
\aftergroup\penalty\aftergroup\@highpenalty}{}{9}{\bff}% chapter
\DeclareTOCEntry{1}{}{}9.9}{}[9.9]% section
\DeclareTOCEntry{2}{}{}9.9.9}{}[9.9.9]% subsection
\DeclareTOCEntry{3}{}{}{}(qquad)% subsubsection
```

The number prototype for figures and tables is '9.9' here. The \lambdacker entry applies the run-in section skip before it and redefines the \dotsep command to remove dot leaders. Using the \aftergroup command, it inserts the \dhighpenalty after this toc-entry to avoid a page break at this point. The left margin adjustment after section and nested toc-entries is calculated here using the prototype of widest section number. This produces the following nesting:

1 Chapter

- 1.1 Section
 - 1.1.1 Subsection Subsubsection

6 Declare New Float Types

The standard LATEX classes provide two types of floating environments: figures and tables. If you have prepared a new floating environment in some way (i.e., using the float package by Anselm Lingnau), you can declare a caption for the new float with the commands described in previous sections.

\RegisterFloatType

In books, when a new chapter starts, the \chapter command puts a special vertical skip to the contents of list of figures and of list of tables. This behaviour can be easy extended to new float types if you register them within this package. The registration is provided with the following command:

```
\RegisterFloatType{\langle float-type \rangle}
```

After the float type is registered, you can declare a toc-entry for it using the negation of its registration number in the $\langle level \rangle$ parameter. The first new float type is registered third (after the figure and table). So, you must use $\langle level \rangle = -3$ for it, -4 for the next registered float type and so on.

In the following example, we define a new float type, program, and prepare the caption and toc-entry commands for it. The caption of programs is supposed to be used at the beginning of program. So, we make it in the same manner as the table caption.

```
\documentclass{book}
\usepackage{float,nccsect}
\newfloat{program}{tp}{lop}[chapter]
\floatname{program}{Program}
\RegisterFloatType{program}
\DeclareSection{-3}{program}{{0pt}{10pt}{}}
\DeclareTOCEntry{-3}{}{9.9}{}
```

To produce a list of programs, you can then use the **\listof** command from the float package as follows:

```
\listof{program}{List of Programs}
```

7 Epigraphs and Related Staff

\beforechapter \epigraph

To put epigraph before any chapter, you can use two methods: low-level $\begin{tabular}{l} \textbf{beforechapter} \{\langle anything \rangle\} \end{tabular}$ hook or user-level command

```
\left[\left\langle width\right\rangle\right] \left\{\left\langle text\right\rangle\right\} \left\{\left\langle author\right\rangle\right\}
```

The last one applies a special formatting to epigraph and calls the first one. The \beforechapter hook inserts its contents at the beginning of page just before a chapter instead of spacing specified in the chapter declaration.

\epigraphparameters

Formatting of user-level epigraph is provided with the following command

```
\label{eq:continuous} $$ \operatorname{continuous} {\langle style \rangle} {\langle width \rangle} {\langle author-style \rangle} {\langle after-action \rangle} $$
```

Here $\langle style \rangle$ is a style applied to the whole epigraph (font selection, spacing and positioning, etc.), the $\langle width \rangle$ is the default epigraph width (can be changed in an epigraph), the $\langle author\text{-}style \rangle$ is the style applied to the author's signature, and the $\langle after\text{-}action \rangle$ is an action applied after the epigraph (usually a vertical spacing). All styles and actions are applied in the vertical mode. An $\langle author\text{-}style \rangle$ can finish with one-argument macro getting the author of epigraph and formatting it.

\epigraphwidth

In \epigraphparameters, you can use the \epigraphwidth macro which contains a selected epigraph width.

The default style is:

\StartFromTextArea

The \vspace* command applied at the beginning of page has one serious disadvantage: it skips more space that specified in its parameter. To remove this disadvantage, we introduce the \StartFromTextArea command that inserts a zero-height strut and allows use the \vspace command after it without troubles.

\StartFromHeaderArea

You can also extend the text area on the header if apply the \StartFromHeaderArea command at the beginning of page. Such action is useful in epigraphs: the first chapter's page usually has an empty header and positioning an epigraph from the header is the good practice.

8 Declare Part

The \part command in book-like classes is the only sectioning command that cannot be prepared with the \DeclareSection command. So, we add special declarations to provide parts in books with features of other sectioning commands. To redefine the \part in books, use the following declaration:

\DeclarePart

 $\verb|\DeclarePart|{|\langle before\rangle|} {|\langle after\rangle|} {|\langle prefix\rangle|} {|\langle style\rangle|}$

- $\langle before \rangle$ an action applied before a part at the beginning of page. It usually specifies a vertical skip \vfil and a paragraph style to be applied to the part number tag and title.
- $\langle after \rangle$ an action applied after the part. It usually contains $\$ and page finishing commands.
- \(\partial prefix\)\) a prefix inserted before a part tag. It contains style commands to be applied to the tag and the \(\nabla space\) command specifying a distance between the part tag and title. The \(\nabla partname\) command goes right after the prefix.
- $\langle style \rangle$ a style to be applied to the part title. It can end with \MakeUppercase.

The default declaration of the \part is the following:

The \StartFromTextArea command prevents ignoring a vertical space at the beginning of page. All paragraphs of part title are centered horizontally using the \centering declaration, and the title is centered vertically using \vfil commands before and after it. A page after the part is made empty in two-side mode if it is even. The space after the part tag is set to 4ex.

In Russian typesetting tradition, the part can be prepared in the same manner as a chapter, i.e. a text going after a part is prepared on the same page with the part title. It is easy to re-declare the part in such style. Let us start a part from the header and delimit it from the text with a decorative line. The following declaration does this:

But when a chapter goes right after a part, we need to place the part and chapter titles together on the same page. This can be applied using the **\beforechapter** hook:

```
\beforechapter{\part{\langle part\ title \rangle}} \chapter{\langle chapter\ title \rangle}
```

Modifiers stored in the parameter of \beforechapter hook will act on the \part command. Modifiers outside of \beforechapter will act on the \chapter command

\DeclareTOCPart

To produce a toc-entry command for a part, the following declaration is specified for book-like classes:

 $\langle action \rangle$ an action applied before the part toc-entry. It usually a skip before part. It is recommended to prepare it with \NCC@secskip command.

 $\langle afterskip \rangle$ a skip after this entry. If it is omitted, the default **\NCC@runskip** value is applied after this entry.

 $\langle prefix \rangle$ a prefix inserted before a part tag (usually empty).

 $\langle prototype \rangle$ a prototype of part tag used for calculation the hang indent in this entry.

\(\style\)\ a style applied to the whole text of entry and to the page number. The \(\makeUppercase\) is allowed to finish this parameter. The \(\applystyle\) command can be used inside it to apply different styles to the toc-entry and the page number.

The default declaration of the part toc-entry is the following:

```
\DeclareTOCPart{\NCC@secskip{4ex \@plus .2ex}% \def\@dotsep{1000}}% \{\partname\ II}{\large\bff}
```

9 The Implementation

The afterpackage package is used to add compatibility commands.

- $1 \langle *package \rangle$
- 2 \RequirePackage{afterpackage}

\NCC@secskip \NCC@runskip The package shares the following commands with the nccthm package:

\NCC@secskip{ $\langle skip \rangle$ } adds the $\langle skip \rangle$ before a section, \NCC@runskip is a skip inserted before run-in sections.

We protect the definitions of these commands with testing the nccthm package to be already loaded.

```
3 \@ifpackageloaded{nccthm}{}{\"
    \def\NCC@secskip#1{%
       \if@noskipsec \leavevmode \fi \par
5
       \if@nobreak \everypar{}\else
7
         \addpenalty\@secpenalty
8
         \addvspace{#1}%
9
       \fi
    }
10
    \label{lem:ccornskip} $$\def\NCCOrunskip{2.75ex \Oplus 1ex \Ominus .2ex}$
11
12 }
```

\runinsectionskip

This command is useful in toc-entries:

 $13 \verb|\newcommand{\runinsectionskip}{\ncc@secskip{\ncc@runskip}}|$

9.1 The Kernel

We start with declaring the section controls (modifiers):

NCC@nosectag is true if \noheadingtag is applied;

NCC@secstartag is true if $\headingtag*{\langle tag \rangle}$ is applied;

\NCC@sectag saves a value of the \headingtag parameter;

NCC@nosecmark is true if \norunninghead is applied;

 $\label{eq:command} $$\operatorname{CCQsecmark}(\operatorname{mark-command})$ executes the $$\langle \operatorname{mark-command}\rangle$ with the parameter of $$\operatorname{runninghead}$ command;$

NCC@noaux is true if \skipwritingtoaux is applied.

```
14 \newif\ifNCC@nosectag
15 \newif\ifNCC@secstartag
16 \newif\ifNCC@nosecmark
```

17 \newif\ifNCC@noaux

\NCC@global

We reset all controls globally, but in the \beforechapter hook we need to reset them locally. So, we reset all controls using the \NCC@global modifier which value is \global by default.

18 \let\NCC@global\global

\NCC@sec@reset@controls

This command resets all controls to default values. It must be applied at the end of every section command.

```
19 \def\NCC@sec@reset@controls{%
20 \NCC@global\NCC@nosectagfalse
21 \NCC@global\NCC@sectagtalse
22 \NCC@global\let\NCC@sectagtalse
23 \NCC@global\NCC@nosecmarkfalse
24 \NCC@global\let\NCC@secmark\relax
25 \NCC@global\NCC@noauxfalse
26 }
27 \NCC@sec@reset@controls
```

 \n

User interface to section controls:

\runninghead

28 \newcommand{\norunninghead}{\NCC@global\NCC@nosecmarktrue}

\noheadingtag

29 \newcommand*{\runninghead}[1]{\NCC@global\def\NCC@secmark##1{##1{#1}}}
30 \newcommand{\noheadingtag}{\NCC@global\NCC@nosectagtrue}

\headingtag
\headingtag*

31 \newcommand{\headingtag}{%

\skipwritingtoaux

 $32 \ensuremath{\mbox{\ccosetsectag}}\$ 33 }

34 \def\NCC@setsectag#1{\NCC@global\def\NCC@sectag{#1}}

\NCC@makesection

The $\CCC_{action} {\langle type \rangle} {\langle toc-entry \rangle} {\langle toc-entry \rangle} {\langle toc-action \rangle}$ produces a section or caption. It analyzes the modifiers and customizes sections or captions. The $\langle toc-action \rangle$ parameter contains an attendant action that must be applied at the end of macro. It writes a toc-entry to aux-file.

The command uses the following hooks that must be prepared before its call:

 $\CCQmakesectag{\langle value \rangle}$ produces a tag in $\Qcounter{Qcountry}$ using the given value;

\NCC@make{ $\langle action \rangle$ } makes a section or caption heading and applies the $\langle action \rangle$ after heading. Before the call of this command, the \@svsec macro is prepared (it contains a prepared tag).

We start from the case when the $\mbox{\local{NCC@sectag}}$ modifier was applied and the section tag was saved in the $\mbox{\local{NCC@sectag}}$ macro. We apply the $\mbox{\local{NCC@make}}$ procedure with the given section tag. Attendant actions are ignored for this case.

```
36 \ensuremath{\mbox{NCC@makesection}\#1\#2\#3\#4\{\%,\mbox{\mbox{\mbox{$\%$}}}\
```

37 \ifNCC@secstartag

```
38 \let\@svsec\NCC@sectag
39 \NCC@make{}%
40 \else
```

Prepare a tag creation command in the $\text{the}\langle type\rangle$ macro. We can do some temporary changes here that will be restored at the end of macro. The restore hook is prepared in the NCC@restsec command.

```
41 \ifx\NCC@sectag\relax
```

The \noheadingtag case: we temporary set the secnumdepth counter to very low negative value. This prevents numbering this section:

```
42 \ifNCC@nosectag
43 \edef\NCC@restsec{%
44 \noexpand\c@secnumdepth \the\c@secnumdepth\relax
45 }%
46 \c@secnumdepth -1000
```

The ordinary case: No restore actions is necessary here.

```
47 \else
48 \let\NCC@restsec\relax
49 \ifnum#2>\c@secnumdepth \else\refstepcounter{#1}\fi
```

The $\ensuremath{\mbox{\mbox{\mbox{\sim}}}\ensuremath{\mbox{\mbox{$

```
51  \else
52  \expandafter\let\expandafter\NCC@thesec\csname the#1\endcsname
53  \def\NCC@restsec{%
54  \expandafter\let\csname the#1\endcsname\NCC@thesec
55  }%
56  \expandafter\let\csname the#1\endcsname\NCC@sectag
57  \protected@edef\@currentlabel{\NCC@sectag}%
58  \fi
```

Prepare section tag in the \@svsec command:

```
59 \ifnum #2>\c@secnumdepth
60 \let\@svsec\@empty
61 \else
62 \protected@edef\@svsec{%
63 \protect\NCC@makesectag{\csname the#1\endcsname}%
64 }%
```

We cannot do the marking right now because the producing of section can be suspended to the beginning of the nearest paragraph (in run-in sections). So, we need to prepare a mark action in a command that will save its state as long as necessary. This command is \NCC@makemark.

```
66 \let\NCC@makemark\@empty
67 \@ifundefined{#1mark}{}{%
68 \lifx\NCC@secmark\relax
```

Ordinary case: prepare the section mark with the $\langle toc\text{-}entry \rangle$ parameter.

```
\ifNCC@nosecmark \else
            \def\NCC@makemark{\csname #1mark\endcsname{#3}}%
71
```

of \NCC@secmark. We need to save the \NCC@secmark value in some command and pass this command within \NCC@makemark because the \NCC@secmark could be removed before the use.

```
72
         \else
73
           \let\NCC@savesecmark\NCC@secmark
74
           \def\NCC@makemark{%
75
             \NCC@savesecmark{\csname #1mark\endcsname}%
76
             \let\NCC@savesecmark\relax
77
          }%
        \fi
78
79
```

Make the section. We must apply the restore action at the end action of \NCC@make command by the same reason that the section making may be sus-

```
\ifNCC@noaux
        \NCC@make{\NCC@makemark \NCC@restsec}%
81
82
        \NCC@make{\NCC@makemark #4\NCC@restsec}%
83
      \fi
   Reset modifiers:
    \fi
    \NCC@sec@reset@controls
87 }
```

9.2 **Section Making Commands**

```
\noindentaftersection
```

\indentaftersection Introduce macros controlling indentation after display sections:

```
88 \newcommand{\indentaftersection}{\@afterindenttrue}
```

89 \newcommand{\noindentaftersection}{\@afterindentfalse}

 $\SectionTagSuffix The \SectionTagSuffix{\langle suffix \rangle} sets a default suffix after a section tag.$

```
90 \newcommand*{\SectionTagSuffix}[1]{\def\NCC@asecnum{#1}}
```

 $91 \verb|\Conlypreamble\SectionTagSuffix|$

\sectiontagsuffix

\sectiontagsuffix $[\langle type \rangle]$ {\suffix} changes a suffix after section tag that will be used for sections of the given $\langle type \rangle$. If $\langle type \rangle$ is omitted, the specified suffix will be used in text flow for all sections having no special suffix.

```
92 \newcommand*\sectiontagsuffix[2][]{%
 94 }
```

```
96 \def\NCC@setsectionsuffix#1{%
     \edef\@tempa{NCC@asecnum@\NCC@secname{#1}}%
     \@ifundefined{\@tempa}{%
99
       \let\NCC@asecnumset\NCC@asecnum@
100
     ጉ{%
       \expandafter\let\expandafter\NCC@asecnumset\csname\@tempa\endcsname
101
     }%
102
103 }
```

\RunningSectionSuffix The \RunningSectionSuffix $\{\langle suffix \rangle\}$ sets a suffix after a title of a running sec-

 $104 \verb|\newcommand*{\nunningSectionSuffix}[1]{\def\nCC@asectitle{\unskip#1}}|$ 105 \@onlypreamble\RunningSectionSuffix

\NCC@preparesectag

The \NCC@preparesectag{ $\langle style \rangle$ }{ $\langle before \rangle$ } hook prepares the \NCC@makesectag command:

106 \def\NCCOpreparesectag#1#2{\def\NCCOmakesectag##1{#1#2##1\NCCOasecnum}}

\NCC@secname

The $\NCC@secname{\langle level \rangle}$ command generates section name (main, section, subsection, ..., or section@vi, section@vii, ... for new section levels). This name is used as the second parameter of the \addcontentsline command, in the declarations of toc-entries, and in the style selection command.

```
107 \def\NCC@secname#1{%
     \ifcase#1main\or section\or subsection\or subsubsection\or
109
       paragraph\or subparagraph\else section@\romannumeral#1\fi
110 }
```

\NCC@startsection

The \NCC@startsection command has the same syntax as its non-NCC prototype:

```
\label{eq:local_continuity} $$\CC@startsection{\langle type \rangle} {\langle level \rangle} {\langle indent \rangle} {\langle beforeskip \rangle}$$
                                                 \{\langle afterskip \rangle\}\{\langle style \rangle\}
```

but works in a bit different way: it ignores the sign of $\langle beforeskip \rangle$. In the original version the testing was applied to set an appropriate afterindent mode. But we change this mode using \indentaftersection and \noindentaftersection macros.

```
111 \def\NCC@startsection#1#2#3#4#5#6{%
    \@tempskipa #4\relax
112
    113
114
    \NCC@secskip \@tempskipa
    \label{local} $$\ef{NCC@sect}$$1${#2}{#3}{#4}{#5}{$MCC@ssect}$$3${#4}{$5}{$6}}%
115
116 }
```

\NCC@makesec

The interface of \NCC@ssect and \NCC@sect commands is similar to their LaTeX's prototypes. They are based on the following command:

```
\label{localization} $$\CCQ_{aterskip} = (\langle indent \rangle) = (\langle style \rangle) = (\langle aterskip \rangle) = (\langle action \rangle) = (\langle aterskip \rangle) = (\langle a
```

In fact, there are two versions of this command: the traditional version, \NCC@makesect, and the version with dynamic control of section style, \NCC@makesecx. One of them should be selected before applying the \NCC@ssect and \NCC@sect commands.

\NCC@ssect The starred form of section:

```
\label{localization} $$\CCOssect{\langle indent\rangle}_{\langle beforeskip\rangle}_{\langle afterskip\rangle}_{\langle style\rangle}_{\langle heading\rangle}$$
            117 \def\NCC@ssect#1#2#3#4#5{%
                  \let\@svsec\@empty
            118
                  \NCC@makesec{#1}{#4}{#5}{#3}{}%
            119
                  \NCC@sec@reset@controls
            120
            121 }
           The base form of section:
\NCC@sect
                   [\langle toc\text{-}entry \rangle] \{\langle heading \rangle\}
            122 \def\NCC@sect#1#2#3#4#5#6[#7]#8{%
                  \label{locomake} $$\def\NCC@makesec{#3}{#6}{#8}{#5}}%
            123
                  \label{localization} $\NCC@makesection{#1}{#2}{#7}{%}$
            124
                     \addcontentsline{toc}{\NCC@secname{#2}}}{%
            125
                       \ifnum #2>\c@secnumdepth \else
            126
            127
                          \numberline{\csname the#1\endcsname}%
            128
                       \fi
                       #7%
            129
            130
                    }%
            131
                  }%
            132 }
```

The traditional section making command: \NCC@makesect

```
\label{localization} $$\CCO_{alpha}(dent) = (\langle style \rangle) {\langle heading \rangle} {\langle afterskip \rangle} {\langle action \rangle} $$
```

```
133 \def\NCC@makesect#1#2#3#4#5{%
     \@tempskipa #4\relax
134
     \ifdim \@tempskipa>\z@
135
136
       \begingroup \normalfont
137
          \NCC@asecnumset
```

The \NCC@secttitle{ $\langle style \rangle$ }{ $\langle tag \rangle$ }{ $\langle title \rangle$ } hook prepares traditional display section:

```
\label{locality} $$\CC@secttitle{#2}{\NCC@hangfrom{\hskip $1\relax\@svsec}}%$
138
             {\interlinepenalty \@M\ignorespaces #3\@@par}
139
        \endgroup
140
141
142
```

The \NCC@secptitle $\{\langle style \rangle\}$ $\{\langle tag \rangle\}$ hook prepares running section. The \norunningsuffix modifier applied in the parameter of running section removes a suffix after section title.

```
\def\@svsechd{{\normalfont
143
144
         \NCC@asecnumset
         \def\norunningsuffix{\protect\NCC@nosecsuffix}%
145
         \NCC@secptitle{#2}{\hskip #1\relax{\@svsec}}%
146
            {\ignorespaces #3\NCC@asectitle}#5}}%
147
148
     \fi
     \@xsect{#4}%
149
150 }
151 \def\NCC@secttitle#1#2#3{#1{#2#3}}
152 \def\NCC@secptitle#1#2#3{#1{#2#3}}
153 \newcommand*\norunningsuffix{}
154 \def\NCC@nosecsuffix{\let\NCC@asectitle\@empty}
```

9.3 Create Section Styles

\NCC@hangfrom

\NCC@hangfrom{ $\langle section \ tag \rangle$ } works as the LATEX's \@hangfrom command, but its margins can be adjusted with the \adjustsectionmargins command.

```
\label{localize} $$155 \def\NCC@hangfrom{% $$156 \NCC@setsecmargins{\z@skip}{\z@skip}\NCC@hangsecstyle{\z@}{}\% $$157$$}
```

\NCC@setsecmargins

\NCC@setsecmargins{ $\langle left \ skip \rangle$ }{ $\langle right \ skip \rangle$ } sets section margins and applies the hook that can be defined by the \adjustsectionmargins command.

```
158 \def\NCC@setsecmargins#1#2{%
159 \leftskip\z@skip \rightskip\z@skip
160 \parfillskip\@flushglue
161 \let\\\@normalcr
162 \NCC@adjsecmargins{#1}{#2}%
163 \NCC@secmarginshook
164 }
```

\NCC@adjsecmargins

\NCC@adjsecmargins{ $\langle left \ skip \rangle$ }-{ $\langle right \ skip \rangle$ } adjusts section margins. The \parfillskip value is also adjusted to a difference between stretchabilities of the $\langle left \ skip \rangle$ and the $\langle right \ skip \rangle$. Using this trick, we can easy specify the centerlast style just setting the stretchability of the $\langle right \ skip \rangle$ as a negation of the $\langle left \ skip \rangle$ stretchability. To extract a stretchability from a skip, we simply add it multiplied by -1 (while multiplication the stretchability is removed!).

```
165 \def\NCC@adjsecmargins#1#2{%
166 \setlength\@tempskipa{#1}\advance\leftskip\@tempskipa
167 \setlength\@tempskipb{#2}\advance\rightskip\@tempskipb
168 \advance\@tempskipa -1\@tempskipa \advance\@tempskipb -1\@tempskipb
169 \advance\@tempskipa -\@tempskipb \advance\parfillskip\@tempskipa
170 }
```

\NCC@hangsecstyle

\NCC@hangsecstyle{\langle min tag width\}}{\langle section tag\}\$ starts a hang paragraph and prints its tag. The \langle min tag width\rangle specifies a minimum width of hang indent and \langle pos\rangle specifies an alignment of \langle section tag\rangle (1, c, r) if its width is less than the minimum width.

```
\setlength\@tempdima{#1}%
                                                                      172
                                                                                      \setbox\@tempboxa\hbox{#3}%
                                                                      173
                                                                                      \ifdim \wd\@tempboxa > \@tempdima
                                                                      174
                                                                                              \hangindent\wd\@tempboxa \noindent \box\@tempboxa
                                                                      175
                                                                      176
                                                                                      \else
                                                                                             \hangindent\@tempdima
                                                                      177
                                                                                             \noindent \makebox[\@tempdima][#2]{\unhbox\@tempboxa}%
                                                                      178
                                                                      179
                                                                                      \fi
                                                                      180 }
                                                                        \adjustsectionmargins{\langle left skip \rangle}{\langle right skip \rangle} defines the \NCC@secmarginshook
\adjustsectionmargins
                                                                         macro to be applied after margins are set. To be sure this hook will be applied
                                                                         only once, we release it in the \NCC@sec@reset@controls hook.
                                                                       181 \newcommand*\adjustsectionmargins[2]{%

9.5 Make the Main Section

\partmark Define the \partmark if it is undefined yet.

253 \providecommand*\partmark[1]{\markboth{}{}}

\NCC@startmainsec

The main section is a section of zero level. It is prepared with the following command:

```
\label{eq:localization} $$\operatorname{\operatorname{CQstartmainsec}}(\operatorname{\operatorname{dignment}})_{\langle \operatorname{style}\rangle} \\ (\operatorname{\operatorname{dignment}})_{\langle \operatorname{style}\rangle} \end{aligned}
```

It starts either a new chapter or a new part depending on the class loaded. To decide what version should be prepared, we test the **\chapter** command on existence.

```
254 \ensuremath{\mbox{\sc 0}}\ensuremath{\mbox{\sc 0}}\ensuremath{\mb
```

The case of an article-like class. Zero-level section is the \part.

```
255 \def\NCC@startmainsec#1#2#3#4#5{%
256 \NCC@preparesectag{\leavevmode#2}{\partname\nobreakspace}%
257 \NCC@secskip{#3}%
258 \secdef{\NCC@part{#1}{#4}{#5}}{\NCC@spart{#1}{#4}{#5}}%
259 }
```

\ncc@spart Prepare the starred version of part:

```
\verb+NCCQspart+{+} a lignment+{+} \{ \langle afterskip \rangle \} \{ \langle style \rangle \} \{ \langle heading \rangle \} \}
```

```
260 \def\NCC@spart#1#2#3#4{%

261 \let\@svsec\@empty

262 \NCC@makepart{#1}{#3}{#4}{#2}{}%

263 \NCC@sec@reset@controls

264 }
```

\NCC@part Prepare the non-starred version of part:

```

                              564
                              565 }
                              566 \let\NCC@floatlist\@empty
                              567 \@onlypreamble\RegisterFloatType
               \ncc@infloats The \ncc@infloats\{\langle action \rangle\} command applies the given \langle action \rangle to all regis-
                               tered float types. During the cycle, the \@captype contains a name of float and
                               the \@tempcnta is equal to its registration number (1 for the figure float, 2 for the
                               table float, and so on).
                              568 \def\NCC@infloats#1{%
                                   \@tempcnta\z@
                              569
                                    \let\NCC@temp \@captype
                              570
                                    \expandafter \@tfor \expandafter \@captype
                              571
                                      \expandafter :\expandafter =\NCC@floatlist \do
                                   {\advance\@tempcnta\@ne #1}%
                              574
                                   \let\@captype\NCC@temp
```

575 }

9.8**Declare Sections and Captions**

Now we can implement the \DeclareSection command. It generates: \DeclareSection

```
\NCC@mainsection command if \langle level \rangle = 0;
 \NCC@section\langle level-in-roman \rangle command if \langle level \rangle > 0;
 \NCC@cap@\langle float\text{-}type \rangle command if \langle level \rangle < 0.
576 \newcommand{\DeclareSection}{\@ifstar{\NCC@dsecx}{\NCC@dsec}}
577 \def\NCC@dsec#1#2{%
     579 }
580 \@onlypreamble\DeclareSection
```

581 \@onlypreamble\NCC@dsec

\ncc@dsect The non-starred version of section declaration command prepares display sections with traditional formatting:

```
\label{eq:local_local} $$\CCOdsect{\langle level\rangle}{\langle type\rangle}[\langle indent\rangle]{\langle prefix\rangle}{\langle beforeskip\rangle}$}
                            {\langle afterskip \rangle} {\langle style \rangle}
```

It is also used for generation of run-in sections and captions.

```
582 \def\NCC@dsect#1#2[#3]#4#5#6#7{%
     \lim 1>\z0
583
       \expandafter\def\csname NCC@section\romannumeral#1\endcsname{%
584
585
         \NCC@setsectionsuffix{#1}%
586
         \NCC@preparesectag{#4}{}%
         \let\NCC@makesec\NCC@makesect
587
         \NCC@startsection{#2}{#1}{#3}{#5}{#6}{#7}}%
588
589
     \else
       \lim 1=\z0
590
         \def\NCC@mainsection{%
591
           \NCC@setsectionsuffix\z@
592
           \let\NCC@secmain\@empty
593
```

The empty \NCC@secmain means standard alignment of main section

```
594
            \NCC@startmainsec{%
595
              \NCC@hangfrom{\hskip #3}\NCC@adjsecmargins{}\@flushglue
596
              \ignorespaces}%
597
              {#4}{#5}{#6}{#7}%
         }%
598
599
       \else
600
          \NCC@dsecf{#2}{#4}{#5}{#6}{#7}%
601
       \fi
     \fi
602
603 }
604 \@onlypreamble\NCC@dsect
```

The starred version of section declaration command prepares display sections with \NCC@dsecx dynamic formatting:

```
\label{localization} $$\CCOdsecx{\langle level\rangle}{\langle type\rangle}{\langle prefix\rangle}{\langle beforeskip\rangle}{\langle afterskip\rangle}{\langle style\rangle}$}
```

It can also be used for generation of captions.

```
605 \ensuremath{ \mbox{ def}\NCC@dsecx#1#2#3#4#5#6{\%} }
606
     \lim 1>\z0
        \expandafter\def\csname NCC@section\romannumeral#1\endcsname{%
607
          \NCC@setsectionsuffix{#1}%
608
          \NCC@setsectionstyle{#1}%
609
          \NCC@preparesectag{#3}{}%
610
          \let\NCC@makesec\NCC@makesecx
611
          \CCQstartsection{#2}{#1}{\zQ}{#4}{#5}{#6}}%
612
613
      \else
       \lim 1=\z0
614
```

The non-empty \NCC@secmain hook means the dynamic alignment. We also redefine the dynamic section style \NCC@sec in such a way that the right skip stretchability will be 1fil if the section style has no flush glue.

```
\def\NCC@mainsection{%
615
            \NCC@setsectionsuffix\z@
616
            \NCC@setsectionstyle\z@
617
            \let\NCC@secsave\NCC@sec \let\NCC@sec\NCC@secflush
618
619
            \def\NCC@secmain{\protect\NCC@sec{}}%
620
            \NCC@startmainsec{}{#3}{#4}{#5}{#6}%
         }%
621
622
       \else
623
          \NCC@dsecf{#2}{#3}{#4}{#5}{#6}%
624
       \fi
625
     \fi
626 }
627 \@onlypreamble\NCC@dsecx
```

\nccosecflush \nccosecflush{ $\langle tag \rangle$ } applies a section style saved in the \nccosecsave macro and adjusts \rightskip and \parfillskip if the left and right margins have no stretchability in sum.

```
628 \def\NCC@secflush#1{\NCC@secsave{#1}%
     \@tempskipa\leftskip \advance\@tempskipa\rightskip
     \advance\@tempskipa -1\@tempskipa
```

There are three general cases in which the correction of right margin is required:

Case	\leftskip	\rightskip	\parfillskip
Left last	x	у	Opt plus 1fil
Center last	x plus 1fil	y plus -1fil	Opt plus 2fil
Right last	x plus 1fil	y plus -1fil	Opt plus 1fil

In all these cases the correction is simple: we need to add \parfillskip to the \rightskip and set \parfillskip to zero.

```
631
     \NCC@ifzeroskip\@tempskipa{%
632
       \advance\rightskip \parfillskip \parfillskip \z@skip
633
     }{}%
```

```
634 \ignorespaces 635 }
```

\NCC@dsecf This command declares captions of floats:

```
\label{eq:local_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_control_cont
```

\DeclarePart In book-like classes, a part is declared in a special way:

```
\verb|\DeclarePart|{\langle before \rangle}|{\langle after \rangle}|{\langle prefix \rangle}|{\langle style \rangle}|
```

Long parameters are allowed in this declaration.

```
644 \@ifundefined{chapter}{}{%
645

653 }
```

9.9 Caption Patches

\@makecaption

We emulate here the $\mbox{\mbox{\tt Qmakecaption}{\tt fnumQ\langle type\rangle}}{\langle caption\rangle}$ command to provide the compatibility with packages using it. It calls the $\mbox{\tt NCCQcapQ}\langle type\rangle$ command using the type specified in $\mbox{\tt Qcaptype}$ command. The counter is already stepped before this command and all necessary things are written to aux. Therefore, we turn off writing to aux and decrease a value of the float counter by -1 because it will be stepped within again.

```
654 \long\def\@makecaption#1#2{%
655 \begingroup
656 \skipwritingtoaux
657 \addtocounter\@captype\m@ne
658 \csname NCC@cap@\@captype\endcsname[]{#2}%
659 \endgroup
660 }
```

Add patch to the **supertabular** package:

661 \AfterPackage{supertabular}{%

```
\long\def\ST@caption#1[#2]#3{\par%
662
       \addcontentsline{\csname ext@#1\endcsname}{#1}%
663
          {\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
664
665
        \begingroup\centering
666
          \def\@captype{#1}%
          \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
667
668
       \endgroup
669
     }
670 }
    Add patch to the xtab package:
671 \AfterPackage{xtab}{%
     \long\def\ST@caption#1[#2]#3{\par%
672
       \@initisotab
673
       \addcontentsline{\csname ext@#1\endcsname}{#1}%
674
675
          {\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
676
       \begingroup\centering
677
          \def\@captype{#1}%
678
          \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
679
       \endgroup
       \global\advance\ST@pageleft -\PWSTcapht
680
       \ST@trace\tw@{Added caption. Space left for xtabular: \the\ST@pageleft}%
681
682
683 }
    Add patch to the longtable package:
684 \AfterPackage{longtable}{\%}
     \def\LT@makecaption#1#2#3{%
685
       \label{local_local} $$ LT@mcol\LT@cols c{\hox to\z0{\hss}} $$
686
          \parbox[t]\LTcapwidth{\centering\def\@captype{table}%
687
            \ifx#1\@gobble \NCC@cap@table*{#3}%
688
            \else \@makecaption{\fnum@table}{#3}%
689
690
            \fi
         }%
691
692
          \hss
693
       }}%
694
     }
695 }
```

9.10 Declare TOC-Entries

\DeclareTOCEntry The toc-entries declaration command:

Declare a toc-entry command for a registered float. We scan the registration list and find the necessary float type comparing its registration number with the negation of level. The generated command is $\10\$ float-type $\$:

```
\int \frac{1}{z^0}
701
                  \@tempswatrue
702
                  \NCC@infloats{%
703
                       \ifnum#1=-\@tempcnta
704
705
                            \expandafter\def\csname 1@\@captype\endcsname
706
                                 {\CC@tocentry\z@{#2}{#3}{#4}{#5}}%
707
                            \@tempswafalse
708
                            \@break@tfor
                       \fi
709
710
                  }%
  Incorrect level number. Generate an error.
                  \if@tempswa
711
                       \@tempcnta#1\relax
712
713
                       \@tempcnta -\@tempcnta
714
                       \PackageError{nccsect}%
                            {Float type registration number \the\@tempcnta\space
715
                              is out of range}{}%
716
                  \fi
717
718
            \else
  Prepare in \@tempa a command name: \l@section or \l@subsection or ... or
  \l@subparagraph or \l@section@vi or ...:
719
                  \lim 1>\z0

                                                                                                              \NCC@latexstarttoc{#1}%
                                                                           811
                                                                                                    \endgroup
                                                                           812
                                                                           813 }
```

9.11 Service and Defaults

\StartFromTextArea \StartFromHeaderArea These commands are applied at the beginning of page to set current position exactly at the first line of text area or at the header line, respectively. Both these commands are defined in two packages: in this one and in the **textarea**. To be sure that the commands are specified in these packages only, we mutually test packages to be loaded.

\bff The \bff command tries to set everything bold.

 $823 \end{\bff}{\normalfont\bfseries\mathversion{bold}}$

\aftersectionvspace

This command eliminates a vertical space inserted after a previous section and inserts a vertical space specified.

```
824 \newcommand*\aftersectionvspace[1]{%
     \ifvmode \if@nobreak
825
826
       \vskip -\lastskip \vskip #1\relax
827
828 }
```

\startsection Define the \startsection command. In article-class, both zero and negative levels refer to the same part section.

```
829 \newcommand*{\startsection}[1]{%
     \lim 1>\z0
       \def\@tempa{\csname NCC@section\romannumeral#1\endcsname}%
831
832
833
       \int \frac{1}{z} dz
          \def\@tempa{\NCC@mainsection}%
834
835
836
          \def\@tempa{\NCC@partsection}%
837
       \fi
838
     \fi
839
     \@tempa
840 }
```

\part Set aliases for almost all section levels, except chapter. The part is called here as \section a section of a negative level.

```
\subsection 841 \det {\text{mone}}
\subsubsection 842 \def\section{\startsection\@ne}
    \paragraph 843 \def\subsection{\startsection\tw@}
\subparagraph 844 \def\subsubsection{\startsection\thr@0}
               845 \def\paragraph{\startsection4}
              846 \def\subparagraph{\startsection5}
```

\caption

Redefine the \caption command. We do this at the beginning of document to reject possible redefinitions of captions in other packages such as float. I think this is not the float's responsibility to decide where a caption must go on: before or after the float body. And what about complicated floats consisting of side floats and etc.? We also reset to zero the \abovecaptionskip and \belowcaptionskip registers if they are specified to provide partial compatibility with the float package. If the registers are not specified (as in ncc class), they are emulated with

```
847 \AtBeginDocument{%
     \def\caption{%
848
849
       \ifx\@captype\@undefined
         \@latex@error{\noexpand\caption outside float}\@ehd
850
         \expandafter\@gobble
851
852
       \else
         \expandafter\@firstofone
853
854
       \fi
```

```
}%
